

PGF-KD SYSTEM TABULATED DATA (EMBEDMENT SPEC)

NOTES & LIMITATIONS

.) This document has been prepared by a Registered Professional Engineer (P.E.), as required by OSHA standard 29 CRF, Part 1920, Subpar	π.Ρ. Ι
.) This tabulated data is for the specific use of KD VI/8 sheeting and the Pacific Shoring Products PGF Sheeting Guide Frame system.	
.) Sheeting shall be ASTM A572 with minimum yield 50 KSI. KD VI/8 sheeting has a section modulus of 4.5 in/ft.	
.) The system must be used in strict compliance with all applicable OSHA guidelines, and limitations outlined in this document. Failure to	
do so can result in serious injury or death.	
.) Soil shall be classified by a Competent Person as type A, B, C, as defined by OSHA regulations.	
.) The competent person must ensure the surcharge limits and equipment setbacks are maintained at all times, unless approved in writing	g
by a P.E. Surcharge loads occur due to heavy equipment, vibrations, or spoil piles and are not included in the maximum depth tables.	
.) Soils shall be sloped in accordance with OSHA Subpart P., and the sheeting shall extend a minimum of 18" above the PGF Sheeting Guid Frame when utilized in conjunction with sloping and benching.	le
) Sheeting Guide Frames shall be used under the supervision and direction of a Competent Person, who is educated and trained in the	
proper use and installation of Sheeting Guides and has experience in the field with trenching and excavation practices, OSHA soil type classification, and recognizing hazardous conditions.	
.) The system shall be inspected prior to each use and monitored daily and when changes in jobsite conditions require to ensure structura	al
sound condition. Any significant damage or alteration to the system without written approval from Pacific Shoring will void this data and all manufacturers' warranty.	
0.) Damages to the system shall be evaluated and repaired under the direction of a Registered Professional Engineer. Missing or damaged	ł
components shall be replaced with Pacific Shoring Product's genuine parts.	
1.) All spreaders shall be secured to sockets with pins or other mechanical connections approved by the manufacturer, prior to shield use.	
Do not apply side or vertical load to the spreaders at any time such as leaning plates/sheeting for soil support, unless approved in writin	ng
by a Registered Professional Engineer (P.E.)	
2.) The groundwater level must be maintained at or below the base of the excavation at all times. If dewatering system is necessary to	
achieve this, it is the contractor's responsibility for developing, installing, and monitoring the dewatering system, and verifying that the	e
groundwater level behind the shoring walls has been lowered at least to the base of the excavation at all times.	
INSTRUCTIONS FOR USE OF THE SHEETING GUIDE FRAME SYSTEM
